RUN II TRIGGER SYSTEM

PJW 9/23/96

Figure 2: Block diagram of the Run II Trigger System.

TSI

2 The Global Level 1 Trigger - b0l1gl00

- a.k.a. FRED
- Forms 64 L1 triggers every 132 ns
- Data from calorimeter, muons, tracking, CLC
- Sends preliminary L1 decision to TS
- Sends 64 L1 triggers to Level 2
- Sends trigger data to scalers for rate accounting
- Monitor L1 trigger rates on the DAQMon “Rates and Deadtimes” GUI.
 - Level 1 design rate = 40 kHz
 - Level Bunch Crossing rate = 1.7 MHz
- Check trigger performance with TRIGMON plots; e.g. comparison of Level 1 data in L1 and L2 trigger banks

3 The Trigger Supervisor - b0tsi00

- Controls the synchronous flow of event data from the Front-end crates to the Event Builder
- Manages the filling and readout of the four Level 2 buffers
- Receives L1A/R recommendation from FRED
- Sends out final L1 decision based on L2 buffer availability
- Receives the L2 decision from the L2 (alpha) crate and sends it to the Front-end crates
- Trigger Manager process sends TS event data to Event Builder
- TS sends LIVETIME accounting signals to scaler crate. Check scaler GUI

4 The Trigger Supervisor - cont.

- TS can control Front-end independently of the trigger
 - Auto L1Accept in “calib continous” mode
 - L1Accept based on external calibration signals
 - Auto L2Accept
- There are 8 Trigger Supervisors

5 The Trigger Crosspoints - b0tsi00

- Responsible for partitioning the detector
- Allows subsets of the ~ 120 Front-end crates to be controlled by different Trigger Supervisors
- Routes TS messages (Level 1, Level 2, Calibration) to the TRACERs in the Front-end crates
- There is only one “physics” partition; i.e. the trigger cannot be partitioned
- Note: Each crate is always listening to one partition

6 The Return Crosspoints - b0tsi02

- Monitors DONE, BUSY and ERROR signals from the TRACERs in the Front-end crates
- DONE de-asserted on receipt of L2 Accept and re-asserted when data readout is complete
- DONE timeout occurs if this takes too long
- BUSY signal sent to RXPT if TRACER/VRB is not ready for another L2A
- BUSY timeout indicates problem at the VRB/EVB interface
- ERROR sent to RXPT from the TRACER if something goes wrong in a Front-end crate
- The ERROR feature is not (yet) widely used
- Monitor Return Crosspoint activity on the DAQ-Mon “RXPT” GUI

Partition **0** is **IDLE** - Last u

DONE

Realtime NOT DONE (0.0 ms elapsed)

34;144;145;146;147;148;149;153;(count=66)

ERROR

Realtime ERROR

32;133;134;138;146;147;149;153;(count=

Crates with latched ERROR

(count=0)

No Error Condition Not running yet

7 The Scaler Crate - b0tsi03

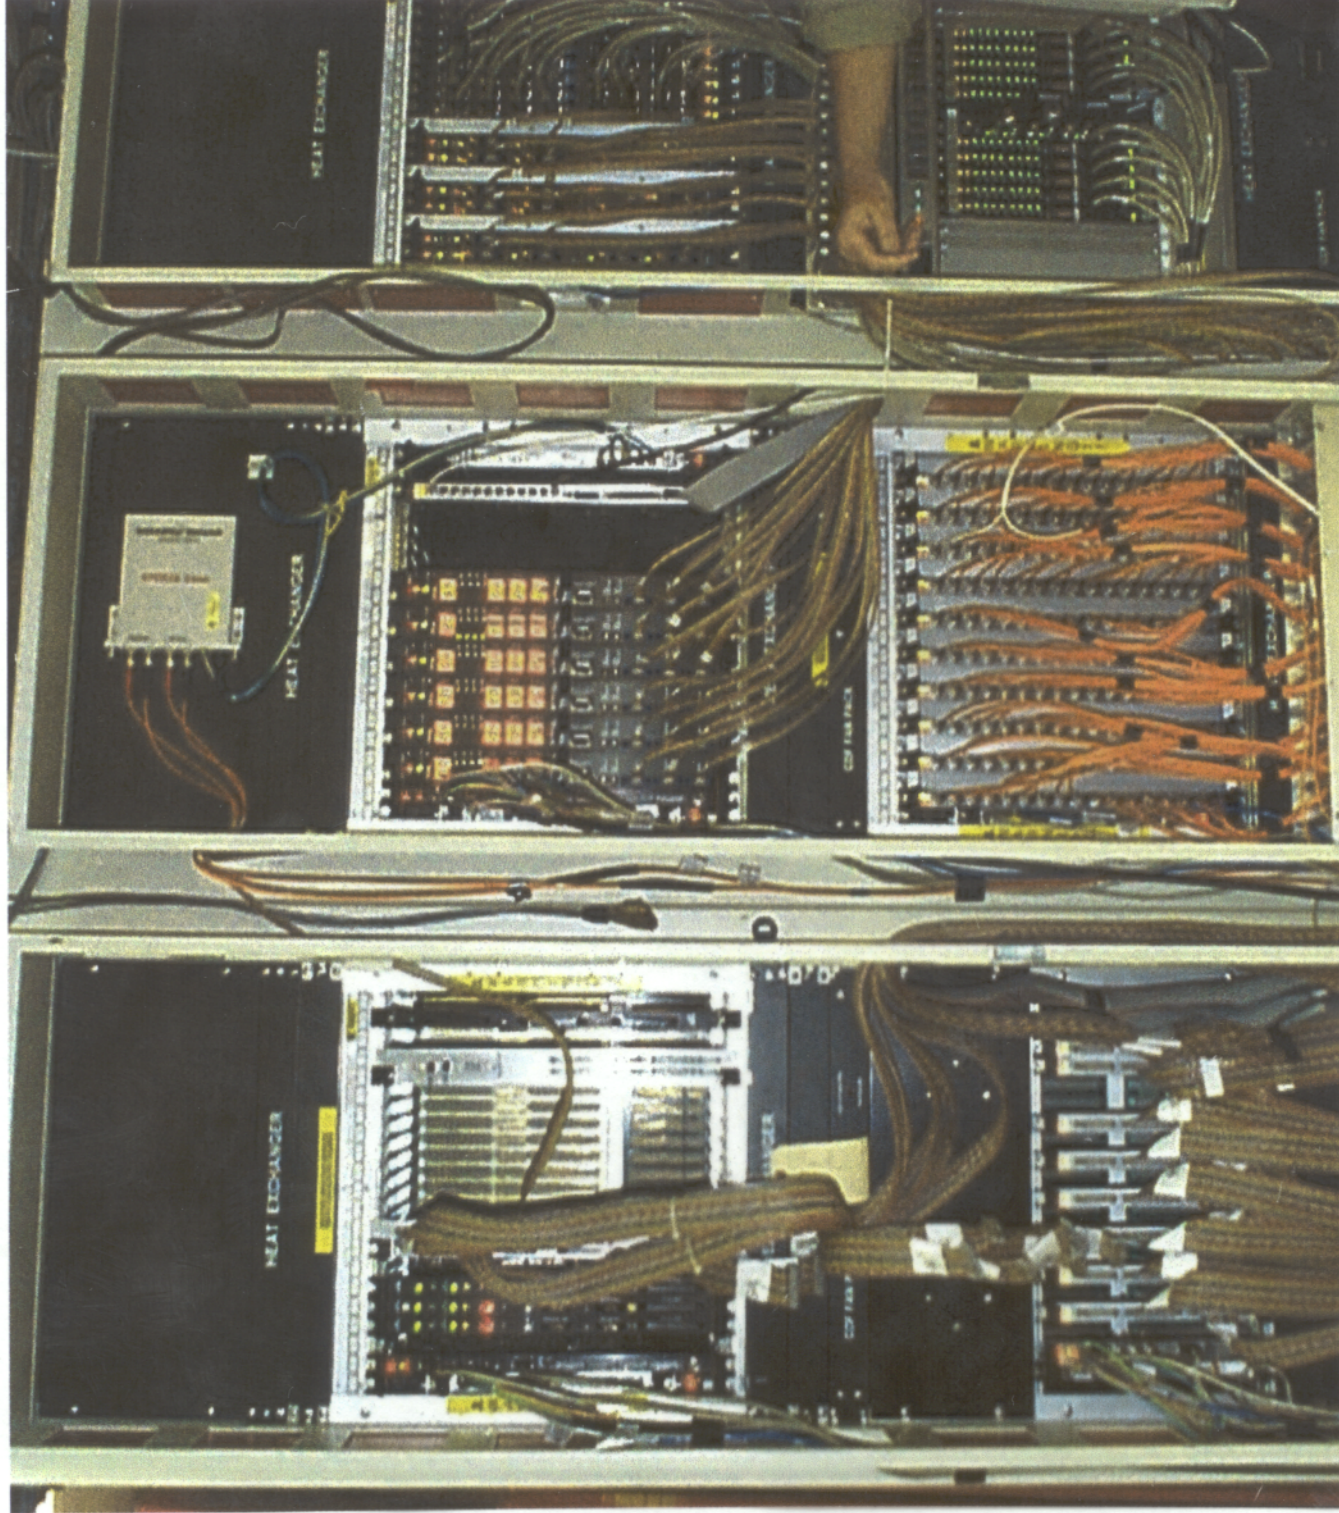

- Provides L1 trigger rates from FRED data
- Provides global L1 and L2 accept rates from the TS
- Provides LIVETIME and DEADTIME accounting from the TS
- Information displayed in real time on scaler GUI
- Scaler data also read out on each L2Accept
